Practical – 7

Practical Title: PHP Form Processing with Server-Side Validation and CSV/JSON File Storage

Problem Definition: Process submitted registration/contact form data using PHP. Validate and sanitize inputs on the server side and store records in CSV or JSON file format. Display success/error messages.

Theory :

1. Is the form submitted using POST?

Yes, the form is submitted using the **POST method**. POST is used to send form data securely to the server. The data is sent in the request body. It is mainly used when we are storing or processing data. So, user data is not directly shown in the URL.

2. Are inputs validated and sanitized server side?

Yes, the inputs are **validated and sanitized on the server side**. Validation checks whether the entered data is correct or not. Sanitization removes unwanted or harmful characters. It helps to prevent wrong and unsafe data from entering the system. So, server-side checking makes the form more secure.

3. Is file writing handled safely?

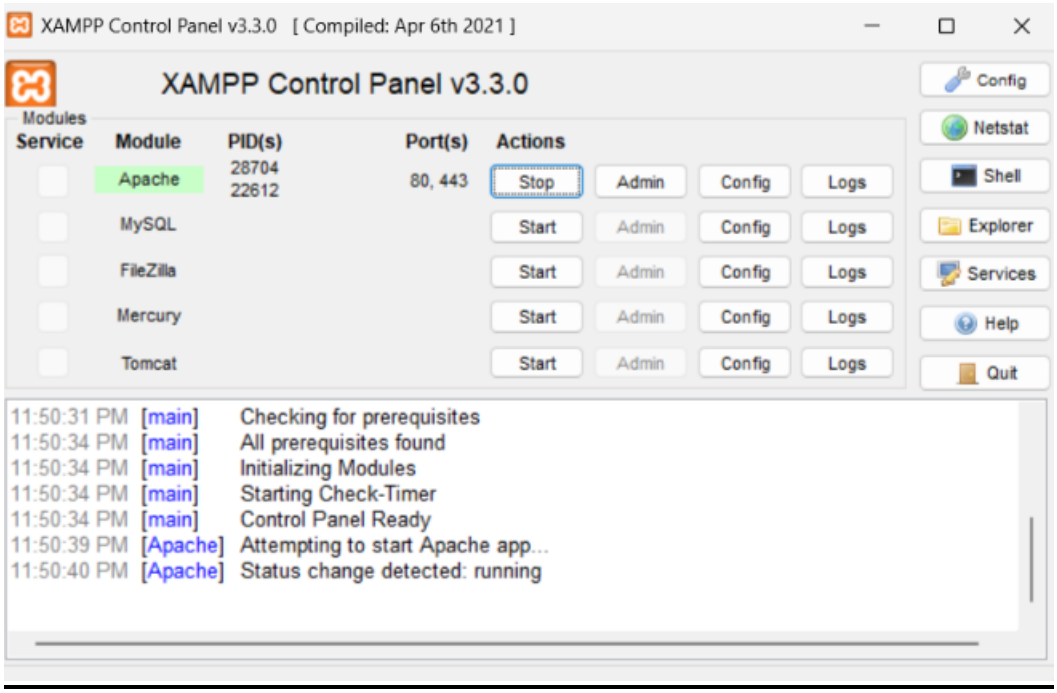

Yes, file writing is handled safely. The server checks the data before writing it into the file. Only required data is stored in the file. This helps to avoid unwanted or harmful data. So, the file is updated in a safe way.

4.Are success and error responses displayed clearly?

Yes, success and error messages are displayed clearly.
When the operation is successful, a success message is shown.
If there is any problem, an error message is shown.
This helps the user understand whether the operation worked or not.
So, the user gets clear feedback after submitting the form.

Implementation/ Output/Result validation of password and Email id using Regex: (Pages with JS)

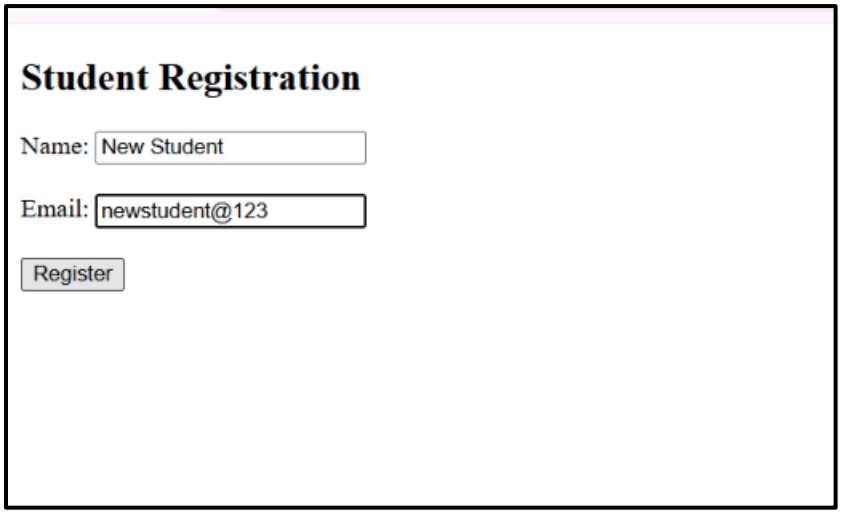

(1)Start XAMMP Local Host Server(APACHE – Start):

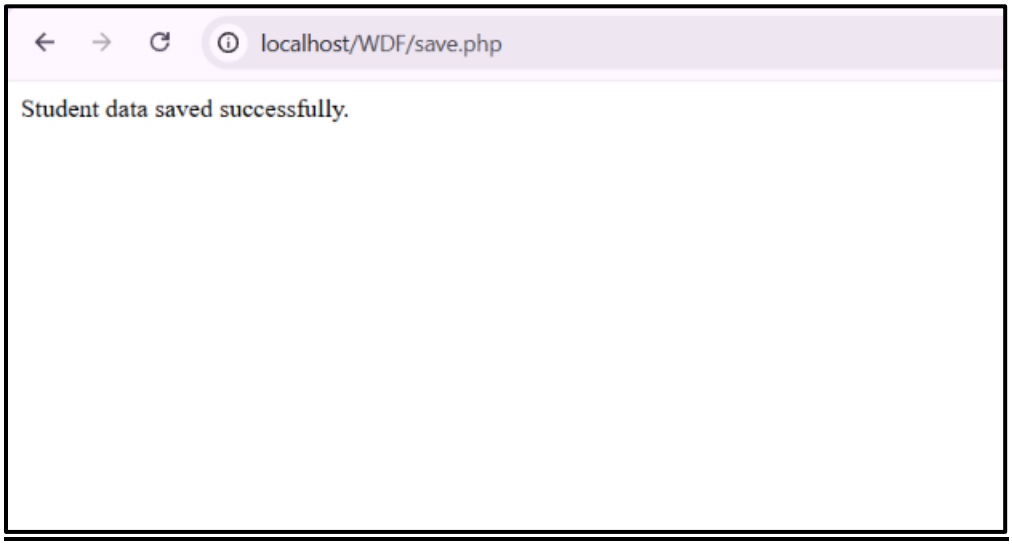

(2)After XAMMP server Starting(APACHE – Starting) try to run register file with Local Host:

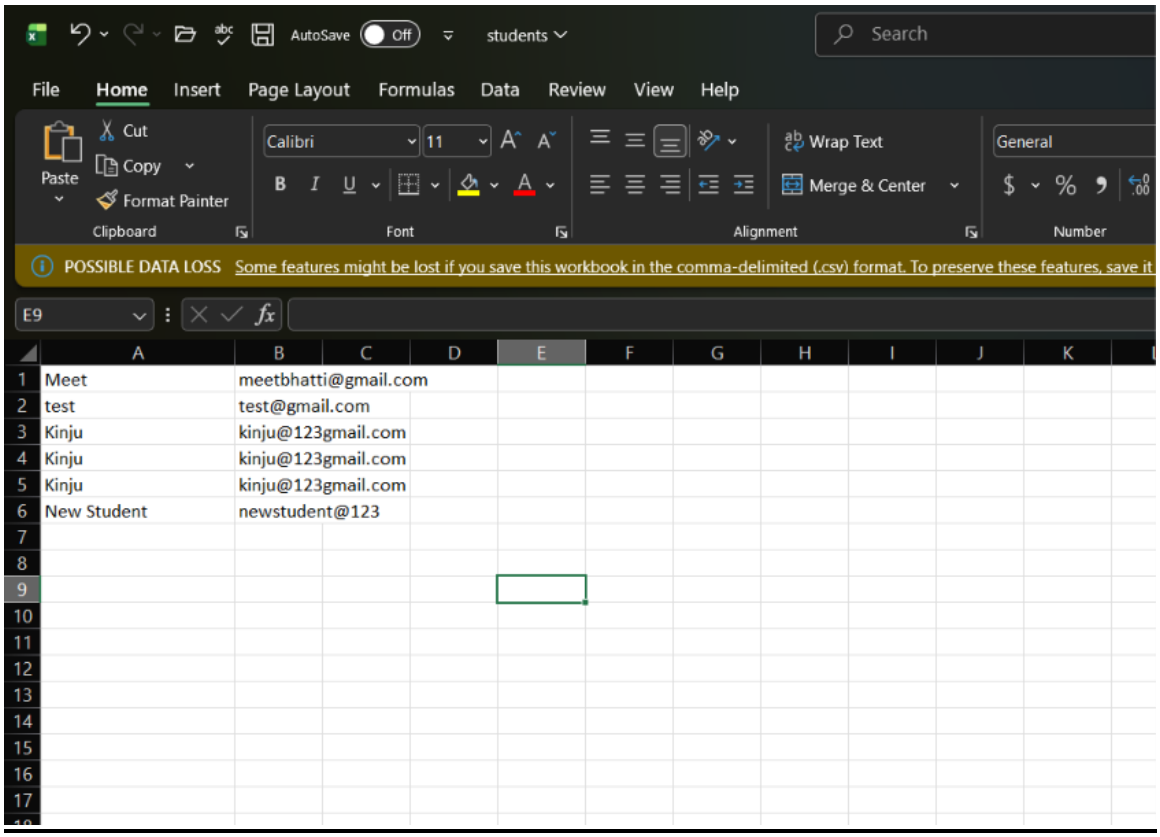

(3)Login:

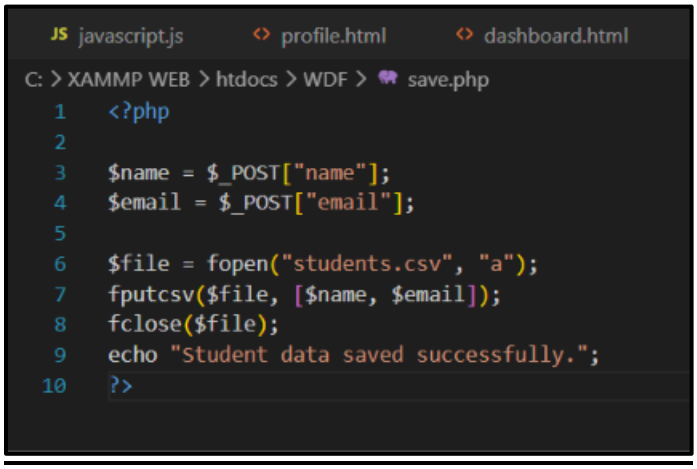

(4)PHP receives successfully data:

(5)Data save in CSV file:

(6)PHP Code:

Learning Outcomes:

- From this practical, I learned how to process forms using **PHP and POST method**.
- I learned server-side **validation and sanitization** of form data.
- I also learned how to store submitted data in **CSV/JSON files**.
- I understood how to handle file writing and errors safely.
- This practical helps me understand how backend form processing works.

Faculty Remarks: (Keep this blank for faculty)
