Practical – 12

Practical Title : Event Management CRUD with Poster Upload and File Validation

Problem Definition: Develop event management functionality for admin users. Admin can add, view, update, delete, and upload event posters with file type and file size validation.

Theory :

1. Are add, update, and delete functionalities implemented correctly?

The INSERT query adds new event details to the database. The SELECT query displays saved events on the webpage. The UPDATE query modifies existing event information. The DELETE query removes the selected event after confirmation. PHP connects the form operations with the MySQL database. These operations help us manage events easily.

2. Is the UI linked with the database correctly?

The user enters event details through the HTML form. PHP receives the submitted values and processes them. MySQLi prepared statements are used to insert or update event information. The saved data is retrieved from the database and displayed on the webpage. This connects the frontend interface with the backend database. It also allows changes to remain saved after refreshing the page.

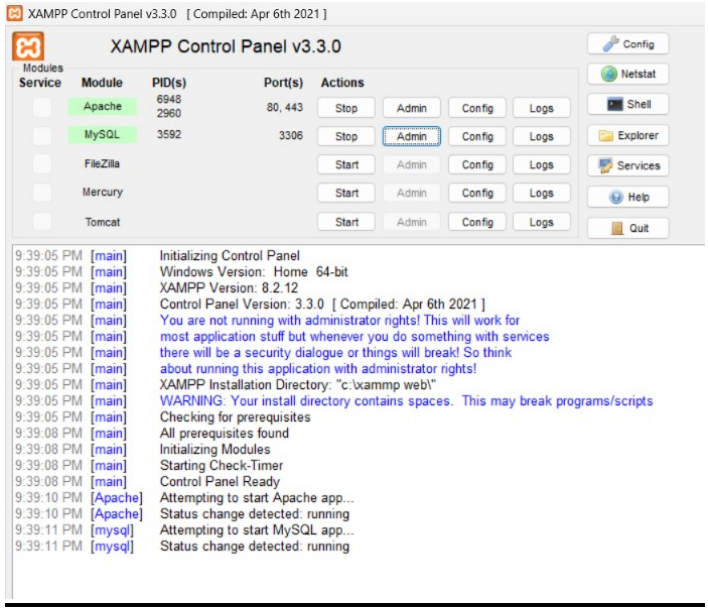

3. Are poster uploads validated for type and size?

The system allows JPG, PNG and WebP poster images up to 2 MB. PHP checks the uploaded file size and its actual image type. It does not rely only on the filename extension. Invalid files and oversized images are rejected with an error message. Valid images are saved in the uploads folder with randomly generated filenames. This helps reduce the risk of unsafe file uploads.

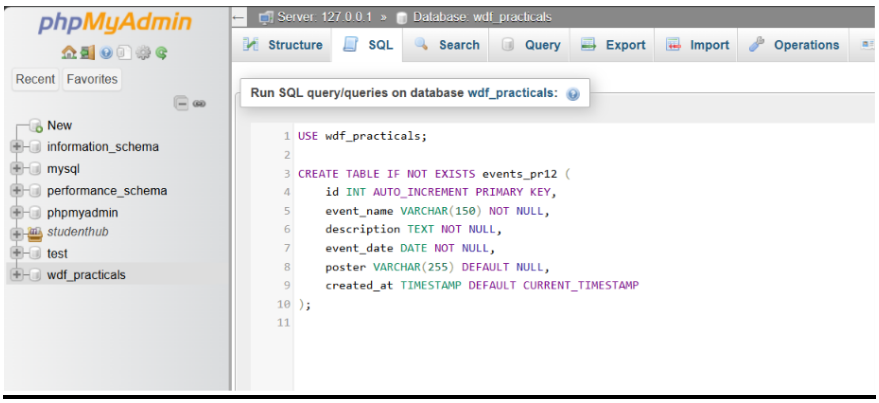

4. Are success and failure messages displayed?

The system displays success messages after adding, updating or deleting an event. These messages are shown after redirecting back to the main page. If required fields are missing, the system displays an error message. Invalid image types and oversized files are also rejected. These messages help users understand whether their operations were successful. They also make the application easier to use.

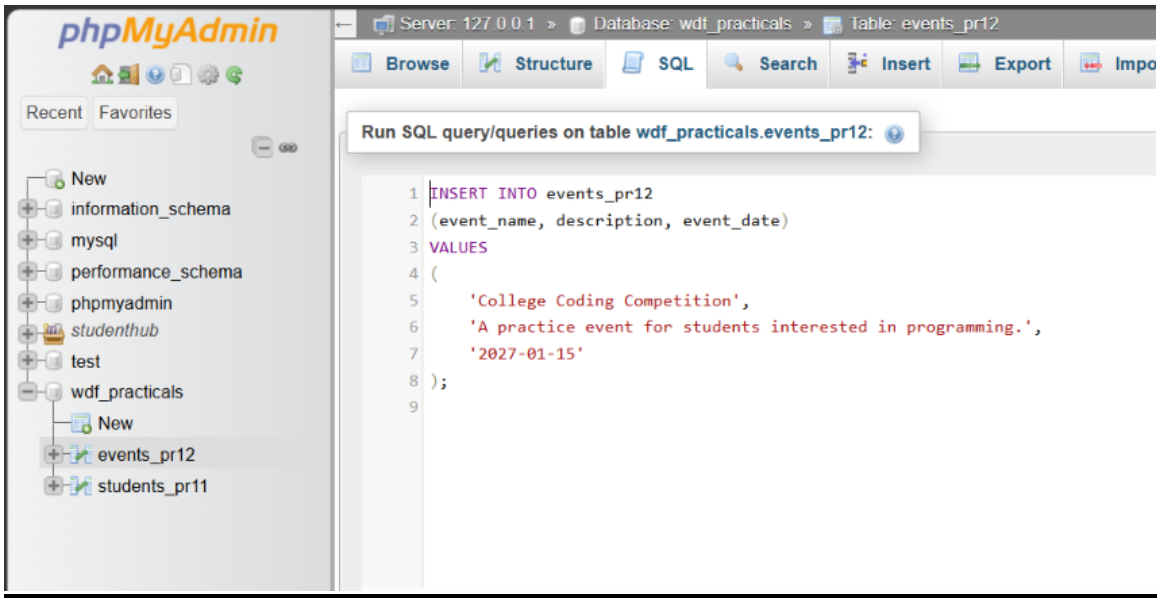

(1)Start XAMMP Local Host Server(APACHE and MYSQL Start):

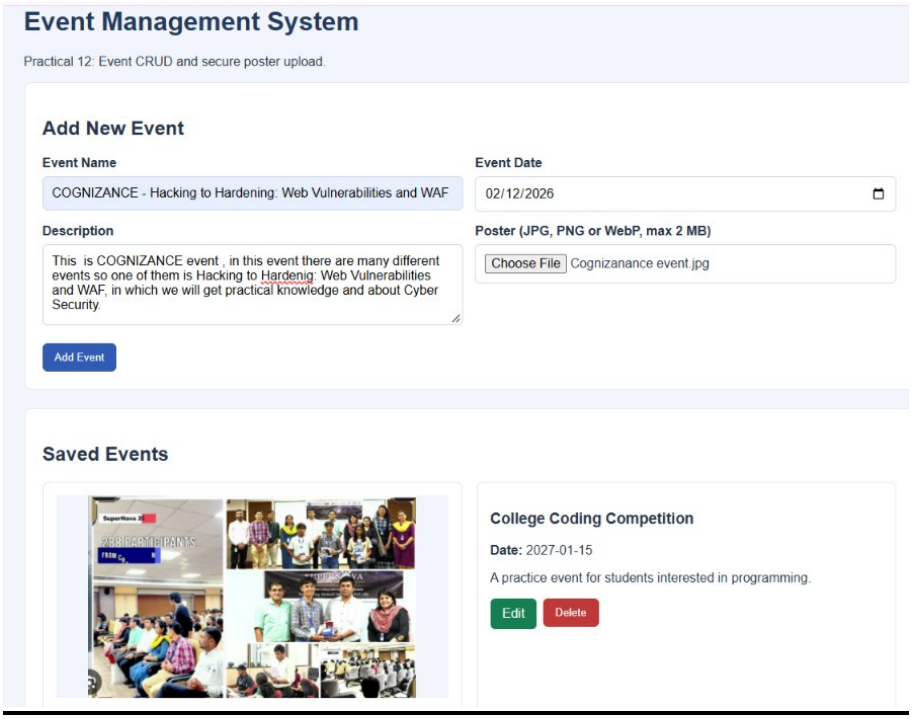

(2)For Event add, edit , delete write SQL query in database :

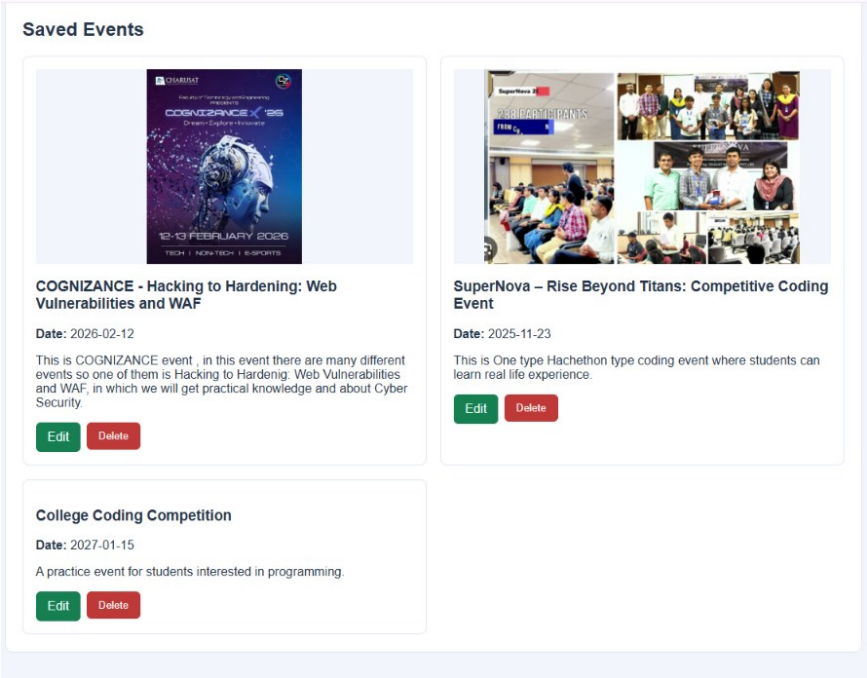

Add One event By inserting SQL Query:

(3)Add New Event :

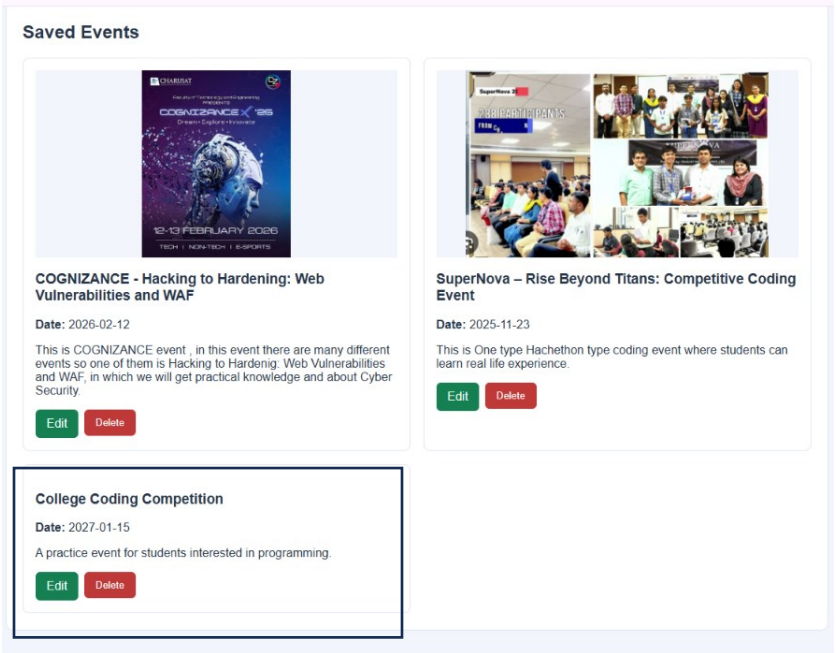

(4)Event Added Successfully :

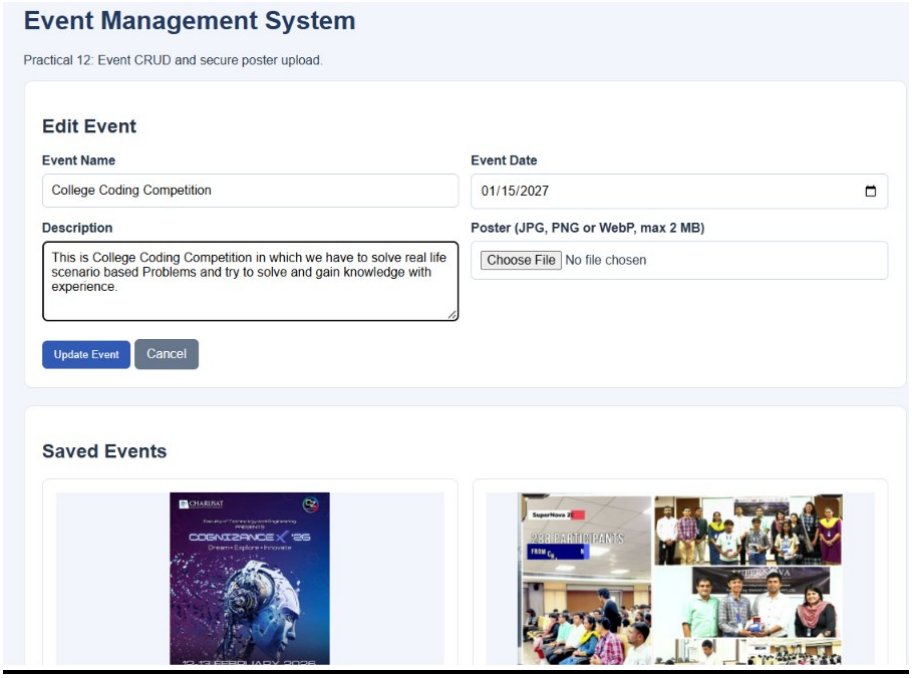

(5)Edit event :

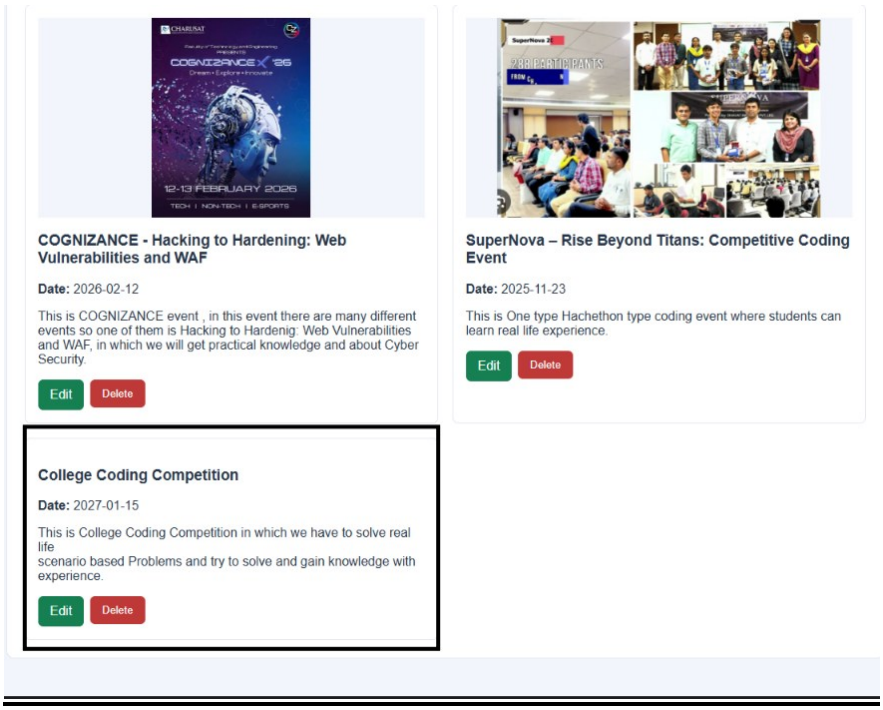

Before Edit event:

Edit:

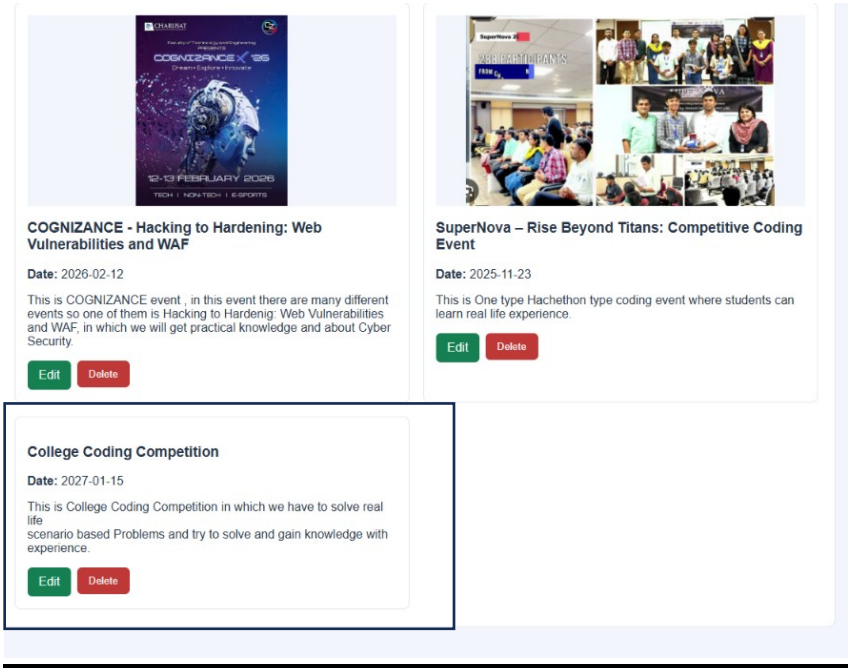

After Edit Details:

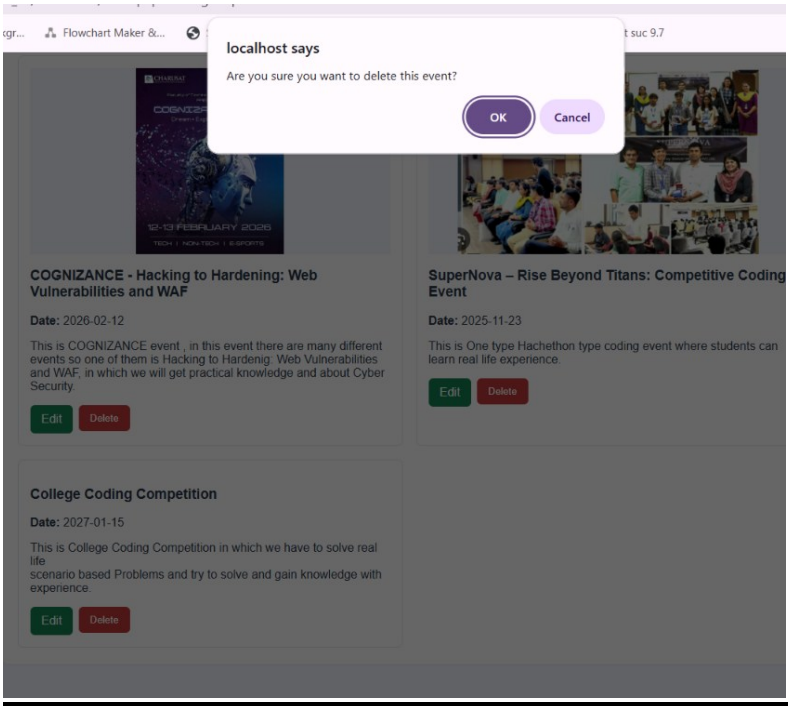

(6)Delete event:

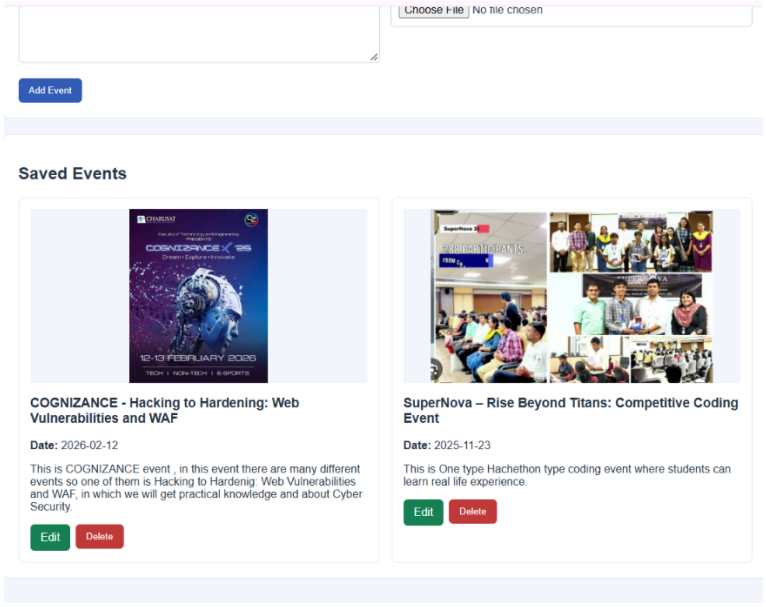

Before Delete:

Delete:

After Delete event:

Learning Outcomes:

In this practical, I learned how to create an event management system using PHP and MySQL. I understood how to add, view, update and delete event records using CRUD operations. I learned how to connect an HTML form with a MySQL database using PHP and MySQLi. I also learned to upload poster images and validate their file type and size on the server. I understood how to store uploaded image filenames in the database and display the images on the webpage. I learned to display success and error messages and ask for confirmation before deleting an event. Overall, this practical helped me understand how to develop a basic event management module with file upload validation.

Faculty Remarks: (Keep this blank for faculty)
