Practical Title: Secure User Registration with Database Insert, Duplicate Email Check, and Password Hashing

Problem Definition: Implement secure user registration by inserting user details into MySQL using MYSQLi. Validate input on frontend and backend, check duplicate email/username, hash passwords using password_hash(), and display appropriate messages.

Theory :

1.Is password_hash() used before storing passwords?

Yes. password_hash() converts the password into a secure hash before it is stored in the database.

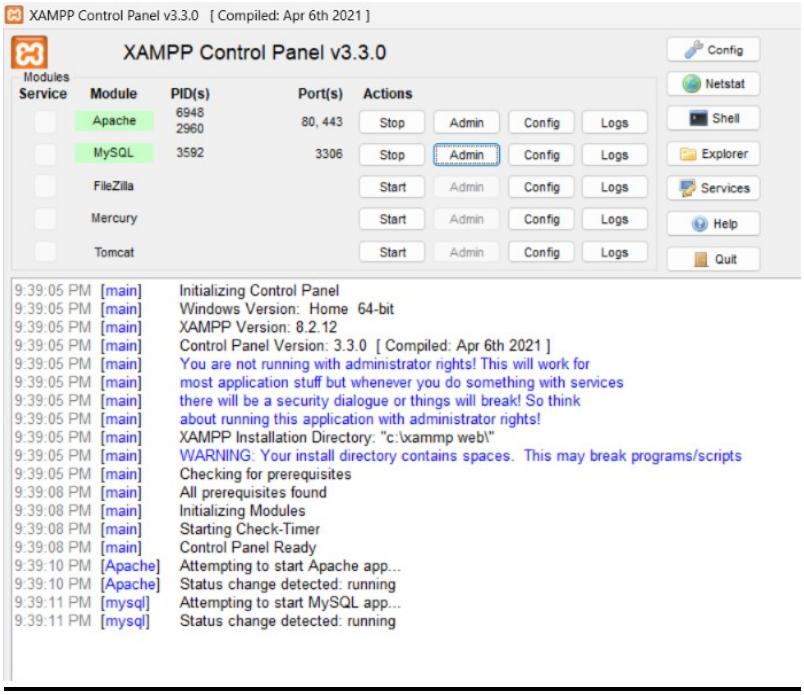

2. Is duplicate email/username checked?

We check whether the email already exists before inserting a new student. A unique database constraint provides additional protection.

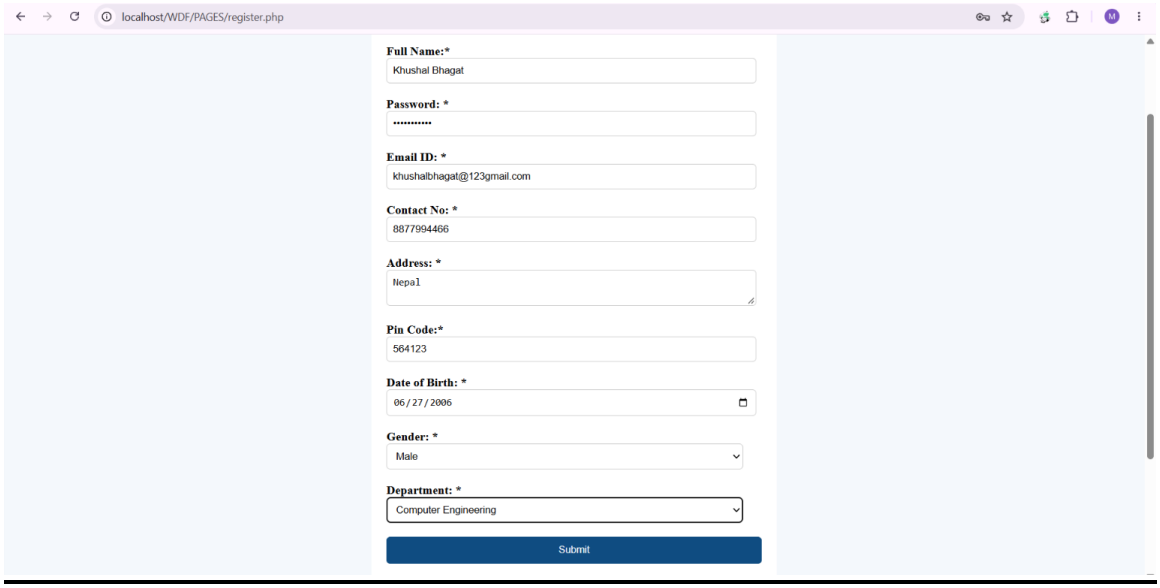

3. Are frontend and backend validations consistent?

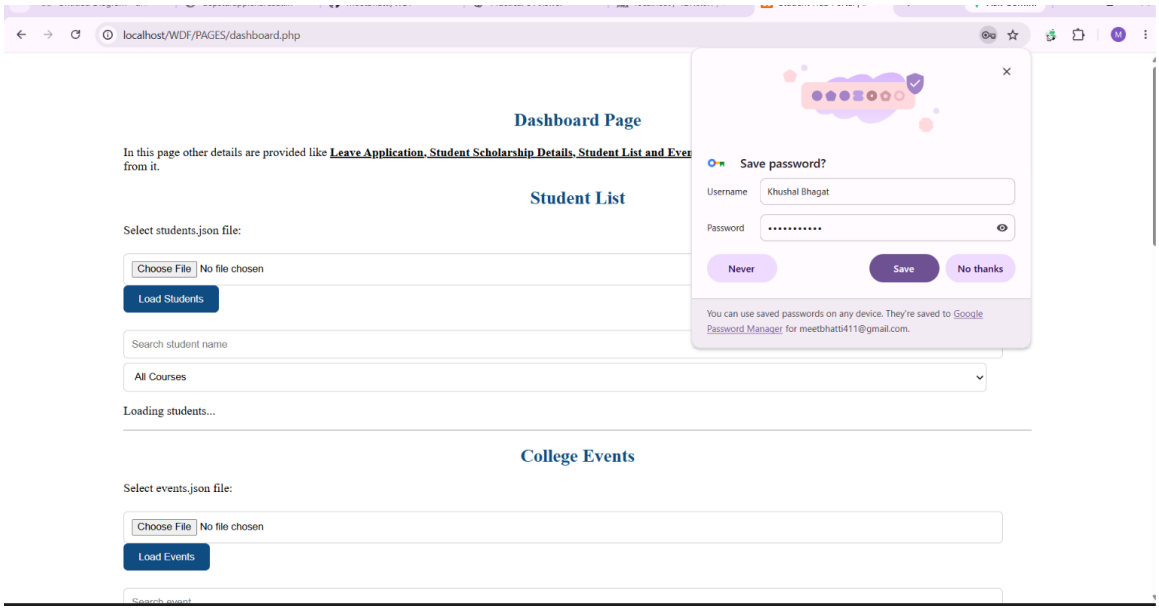

Yes, both should check the same rules, such as password length, email format and PIN code. PHP validation is necessary because browser validation can be bypassed

(1)Start XAMMP Local Host Server(APACHE and MYSQL Start):

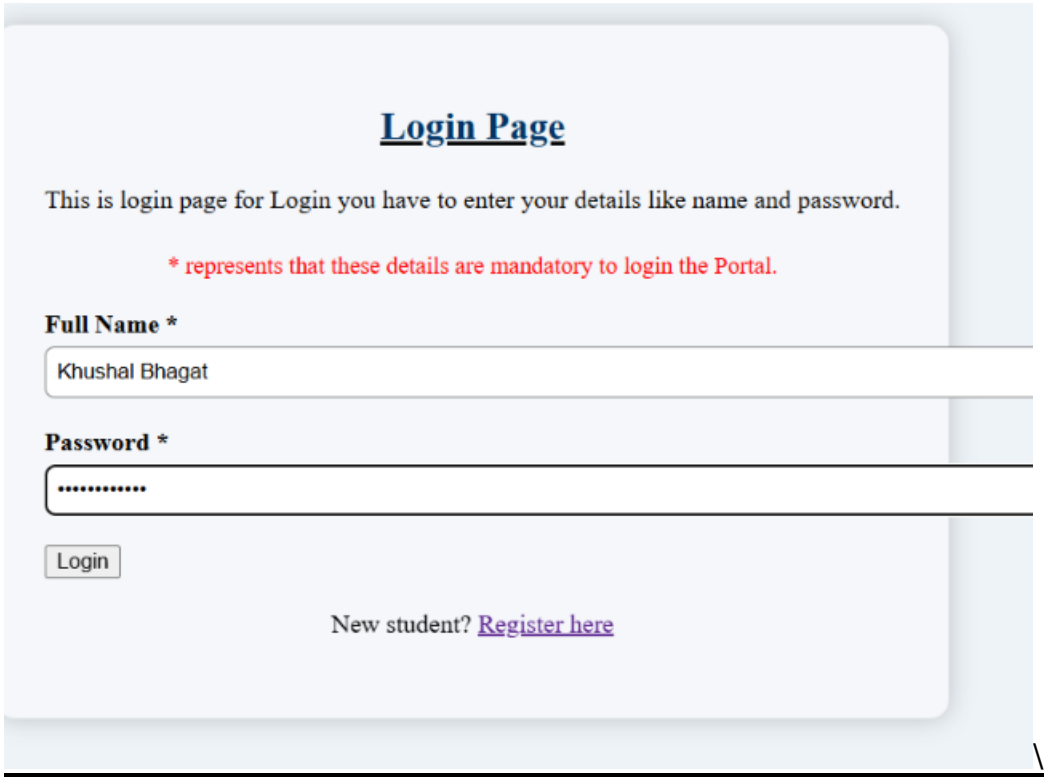

(2)Register with New Student:

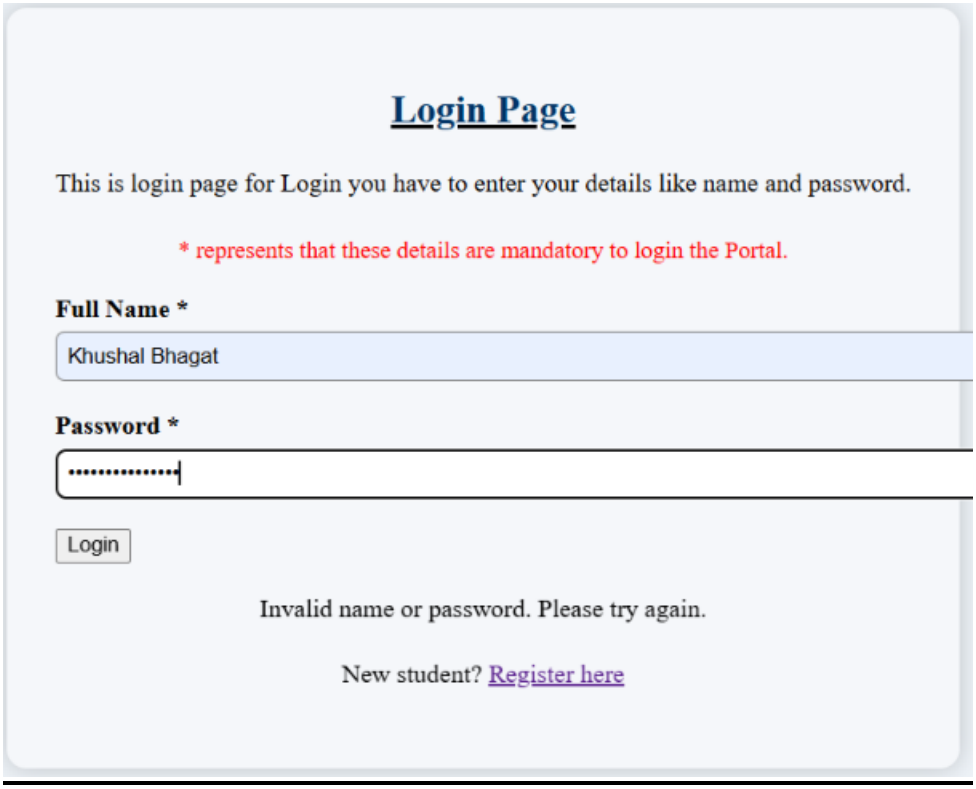

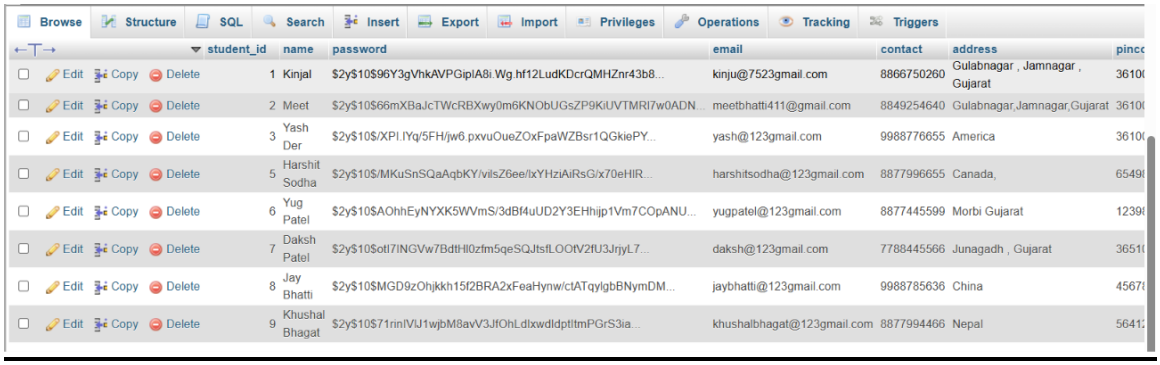

(3)Try to login with same username and password:

(4)Try to Login with wrong password:

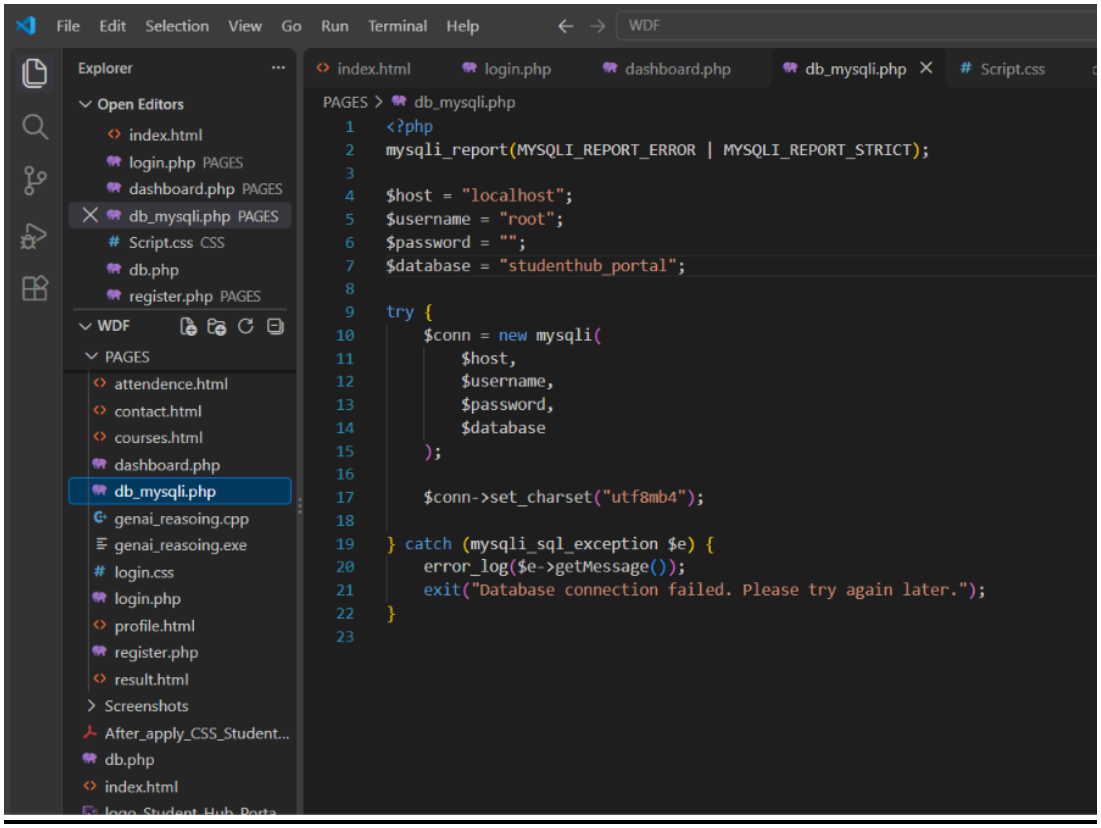

(6)Password in Hashing using password_hash():

Browse | Structure | SQL | Search | Insert | Export | Import | Privileges | Operations | Tracking | Triggers

(7)Use MYSQLI :

GitHub Repository Link:

https://github.com/MeetBhatti/WDF.git

Learning Outcomes:

I learned to create a secure registration form using PHP and MySQLi, validate student details on both sides, prevent duplicate email registration, hash passwords and insert valid data into the database.
